# Agenda

1. About AWS Lambda
2. Getting Started
3. Benefits vs. Drawbacks
4. Use Cases
5. Useful Information
6. Python Demo

# About AWS Lambda

# AWS Lambda

---

○ **AWS Lambda** lets you run code without provisioning or managing servers. You pay only for the compute time you consume - there is no charge when your code is not running. With Lambda, you can run code for virtually any type of application or backend service - all with zero administration.

— According to AWS Developer Guide

# Serverless

---

Serverless are applications where some amount of server-side logic is written by the application developer but is run in stateless compute containers that are event-triggered, ephemeral, and fully managed by a third party. Serverless is also called Function As A Service (FaaS).

— According to Martin Fowler

## How does Serverless help?

---

It helps developers focus on the core business problem and reduces the amount of code they need to write by abolishing the need to run servers and manage infrastructure.

# Getting Started

# Log in to AWS

English

# Go To Lambda

The screenshot shows the AWS Management Console interface. At the top, the browser address bar displays the URL `https://eu-central-1.console.aws.amazon.com/console/home?region=eu-central-1#`. The navigation bar includes 'Services' and 'Resource Groups' dropdowns, along with a notification bell, the region 'Frankfurt', and a 'Support' link. The main content area is titled 'AWS services' and features a search bar with the text 'lambda'. A dropdown menu is open, showing search results: 'Lambda' (highlighted with an orange border and a right-pointing arrow), 'Run Code without Thinking about Servers', 'CodeBuild' (with subtext 'Build and Test Code'), and 'Lex' (with subtext 'Build Voice and Text Chatbots'). Below the search results, a grid of service tiles is visible, including 'Elastic Beanstalk', 'Lambda', 'Batch', 'CodePipeline', 'X-Ray', 'Contact Center', 'Amazon Connect', 'Management Tools' (with subtext 'CloudWatch' and 'CloudFormation'), and 'Game Development' (with subtext 'Amazon GameLift'). On the right side of the console, the 'Featured next steps' section includes two items: 'Manage your costs' (with a calendar icon and subtext 'Get real-time billing alerts based on your cost and usage budgets. [Start now](#)') and 'Get best practices' (with a clipboard icon and subtext 'Use AWS Trusted Advisor for security, performance, cost and availability best practices. [Start now](#)'). Below this, the 'What's new?' section is titled 'Announcing AWS Batch' and includes the text 'Now generally available, AWS Batch enables developers, scientists, and engineers to process large-scale batch jobs with ease. [Learn](#)'.

# Create your function

Select blueprint

Configure triggers

**Configure function**

Review

## Configure function

A Lambda function consists of the custom code you want to execute. [Learn more](#) about Lambda functions.

Welcome to AWS Lambda! You can get started on creating your first Lambda function by choosing one of the blueprints below.

Name\*

Description

Runtime\*

### Lambda function code

Provide the code for your function. Use the editor if your code does not require custom libraries (other than boto3). If you need custom libraries, you can upload your code and libraries as a .ZIP file.

Code entry type

```
1- def lambda_handler(event, context):  
2-     return "Hello hackerspace!"
```

# Execute the lambda function

The screenshot displays the AWS Lambda console interface for a function named 'hello\_hackerspace'. The 'Test' button is highlighted with an orange box. Below the code editor, the 'Execution result: succeeded (logs)' section is shown, with the returned value 'Hello hackerspace' highlighted by an orange box. The 'Summary' section on the left provides details about the code and request, while the 'Log output' section on the right shows the corresponding CloudWatch log entry.

**AWS Lambda**

Dashboard  
Functions

Lambda > Functions > hello\_hackerspace

ARN - arn:aws:lambda:eu-central-1:779196086340:function:hello\_hackerspace

Qualifiers > **Test** Actions

Code Configuration Triggers Monitoring

Code entry type Edit code inline

```
1: def lambda_handler(event, context):  
2:     return 'Hello hackerspace'
```

✓ Execution result: succeeded (logs)

The area below shows the result returned by your function execution.

> "Hello hackerspace"

**Summary**

Code SHA- 256: NY2cj2KppPWZjO1oZymatv0CN-UCMUnvL6KmsfU8-

Request ID: 22e38370-16da-11e7-a226-000279577120

**Log output**

The area below shows the logging calls in your code. These correspond to a single row within the CloudWatch log group corresponding to this Lambda function. [Click here](#) to view the CloudWatch log group.

Log: 22e38370-16da-11e7-a226-000279577120 Invocation: 51 47233

## Lambda function event sources

---

1. HTTP POST request
2. AWS CLI
3. Python **boto3** library
4. Different types of event sources from other AWS resources (API Gateway, S3, Kinesis, SNS, Cloudwatch Logs/Events)

## **Benefits vs. Drawbacks**

## Benefits

---

Built-in fault  
**tolerance**

No infrastructure  
to manage

Scale automatically  
up or down

**Pay only** for what  
you use

**Extend AWS services**  
with custom logic

## Drawbacks

---

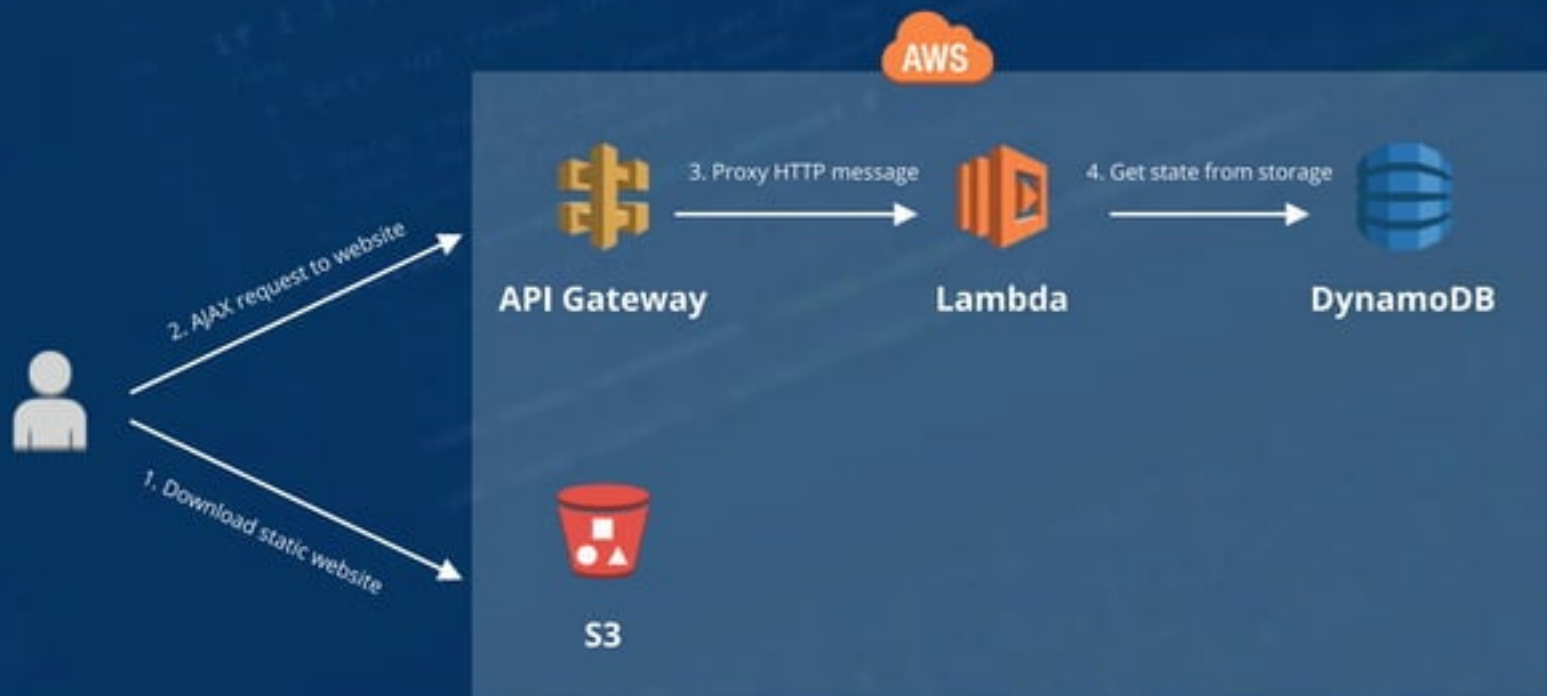

1. Lock into AWS ecosystem
2. New tech that is not battle tested throughout history
3. Long running task that cannot be split into smaller subtasks
4. Non customizable execution environment
5. Not ideal for complex computations with high resource requirements

# Use Cases

## Example 1 - API Backend

## Example 2 - Image Compression

## Example 3 - Cron Management

## Example 4 - Auxilliary FaaS

## Example 5 - Data Pipeline
