

Parsing logs in SUMO Logic is crucial because it modifies the raw log data into structured fields. That makes the search queries more accurate with better results.

Examples

In the first example, we will perform an unparsed log search. As a result, we will receive unparsed logs from the source category starting with “Labs/Apache” within the last 15 minutes.

Query - `_sourcecategory=Labs/Apache/`*

| # | Time | Message |
|---|------------------------------|--|
| 1 | 05/23/2025 1:36:05.133 PM | 178.233.100.114 - - [2025-05-23 12:36:05.133 +0000] "GET /testimonials/ref=vfgb_sdsd_4 HTTP/1.1" 401 7836 "http://www.bing.com/search?q=sumo%20logic&src=IE-SearchBox&FORM=IE11SR" "Mozilla/5.0 (Macintosh; U; Intel Mac OS X 10_6_7; en-us) AppleWebKit/533.21.1 (KHTML, like Gecko) Chrome/19.0.1084.30 Safari/536.5" 6/6310508 Host:apache-prod Name:Http Input Category:Labs/Apache/Access Index:Apache_Access1 |

Under the message section, we can notice the IP address 178.233.100.114. Being an unparsed log, SUMO will not recognize this IP address as a separate field. Therefore, a result of a search query to count the occurrence of each IP address will bring back a general result.

Query - `_sourcecategory=Labs/Apache/`*

| count by ip_address

<<

<

1

of 1

>

>>

Time Compare

▼

| # | ip_address | _count |
|---|------------|--------|
| 1 | | 3,796 |

In the second example, we will use a query parsed with the help of a regular expression (Regex). A regular expression looks for a given pattern and returns the requested result creating a specific field. Using a query below, we can see the desired outcome.

Query - `_sourceCategory=Labs/Apache/`*

| parse regex

"(?<ip_address>\d{1,3}\.\d{1,3}\.\d{1,3}\.\d{1,3})"

| count by ip_address

<<

<

1

of 2

>

>>

Time Compare

▼

| # | ip_address | _count |
|---|----------------|--------|
| 1 | 78.235.33.64 | 102 |
| 2 | 192.168.44.33 | 32 |
| 3 | 158.69.196.112 | 153 |
| 4 | 70.69.152.165 | 195 |
| 5 | 5.35.225.115 | 89 |
| 6 | 192.11.22.33 | 125 |
| 7 | 161.71.8.142 | 118 |
| 8 | 65.98.119.36 | 300 |

For the third example, we can use the unparsed Apache/Error source category first.

Query - `_sourceCategory=Labs/Apache/Error`

| | | |
|----|------------------------------------|--|
| 46 | 05/23/2025 2:19:17.839 PM +0100 | [2025-05-23 13:19:17.839 +0000] [error] mod_log_sql: database connection error: Can't connect to local MySQL server through socket '/var/lib/mysql/mysql.sock' (13) Host:apache-prod Name:Http Input Category:Labs/Apache/Error Index:Error |
| 47 | 05/23/2025 2:19:17.839 PM +0100 | [2025-05-23 13:19:17.839 +0000] [crit] [client 138.124.80.163] Invalid method in request XYZ /dksmnvdfss HTTP/1.0, referer: http://www.yoursites.com/ Host:apache-prod Name:Http Input Category:Labs/Apache/Error Index:sumologic_default |

From the unparsed search result, we want to individualize two entities: the first one will be the client IP address, and the second will be the mod_log_sql message. To refine our search query, we have to input the text below in the search field.

*`_sourceCategory=Labs/Apache/Error`
`| parse "[client *]" as client_ip nodrop`
`| parse "mod_log_sql: *" as message nodrop`*

| # | Time | client_ip | message | Message |
|----|------------------------------------|------------------|--|--|
| 22 | 05/23/2025 2:24:17.838 PM +0100 | | child spawned but unable to open database link | [2025-05-23 13:24:17.838 +0000] [error] mod_log_sql: database connection error: Can't connect to local MySQL server through socket '/var/lib/mysql/mysql.sock' (13) Host:apache-prod Name:Http Input Category:Labs/Apache/Error Index:Error |
| 23 | 05/23/2025 2:24:17.838 PM +0100 | | child spawned but unable to open database link | [2025-05-23 13:24:17.838 +0000] [error] mod_log_sql: database connection error: Can't connect to local MySQL server through socket '/var/lib/mysql/mysql.sock' (13) Host:apache-prod Name:Http Input Category:Labs/Apache/Error Index:Error |
| 24 | 05/23/2025 2:24:17.838 PM +0100 | 118.116.15.26.22 | | [2025-05-23 13:24:17.838 +0000] [crit] [client 138.124.80.163] Invalid method in request XYZ /dksmnvdfss HTTP/1.0, referer: http://www.yoursites.com/ Host:apache-prod Name:Http Input Category:Labs/Apache/Error Index:sumologic_default |

In the final search, we see separate fields for the client_ip and mod_log_sql message. In SUMO Logic, by default, when using the “parse” command, only log lines that match the pattern are kept. “Nodrop” keyword prevents this behaviour by not “dropping” those log lines, but showing every log instead.
