AWS Lambda is an event-driven design. Usually the official DEMO likes to use AWS S3 as an example. When you upload a picture, an Event will be generated, which can drive Lambda to instantly create a thumbnail.

But sometimes, we just need to schedule work, for example:

- .log file cleaning and moving
- . Run reports regularly
- . Specify a specific time to start the EC2 machine (for example, at a certain point before the National Day, 1,000 additional EC2 machines will be added)

Therefore, we need a service similar to cron to regularly generate events to start the program. It would be better if we don't need to open an EC2 to run it.

CloudWatch Events

AWS CloudWatch Events provides such a service. After setting up cron, point the target to your lambda function and you are done.

ps: This service seems to be completely free, I don't see this item on the bill.

Precautions

The time accuracy is not that accurate: if it is triggered once every minute, there will definitely be a delay of several seconds to more than ten seconds.

cron expressions

The cron expressions used here are six groups of strings, which are different from the five groups in general Linux. The difference is that there is an extra Year at the end.

The date & day of the week in cron expressions cannot both be *, one of them must be ?

Example

- ```

1 1. 每分分触发一次 : * * * * ?
2 2. 周一到周五每10分钟一次 : 0/10 * ? * 1-5 *

```
